Note Photoshop is designed to run on a dual-core desktop system running Windows XP, Windows Vista, or Windows 7. The requirements for running Windows 8 (or newer) are the same as those for Windows 7, and we don't recommend upgrading from a Windows XP or Windows Vista installation. You also need a copy of Photoshop CS6 or a later version. For example, the CS6 version is the CS6, which was released in October 2014. Later editions are the CS6.1, the CS6.5, the CS7, the CS8, and the CS10. Each version has updates, but if you have the previous version, you can't buy the upgrades. You'll either have to uninstall the previous version of Photoshop, or you'll have to find the disc you originally installed the program on. (See the box that begins on this page.) If you're running Photoshop for Mac OS X, as opposed to a Windows installation, you need to have an install disc for your Mac. You also need the application to run on your Mac. This means you have to have Mac OS X Lion (10.7), Lion (10.8), or Mountain Lion (10.9), or whatever version later. If you don't already have Photoshop, you can purchase the

Structural analysis of green leaf volatiles emitted by three woody species under different light levels. Flowers and fruits are the main sources of green leaf volatiles (GLVs) in the terrestrial environment and have attracted much attention recently. However, differences in the expression of the GLVs biosynthetic pathway between flowers and fruits have never been systematically studied. Here, we examined the emission of GLVs from leaves of Japanese hop (*Humulus japonicus*), tea (*Camellia sinensis*), and Japanese pear (*Pyrus pyrifolia*) in different light conditions. Characterization of the volatiles emitted from leaves showed that GLVs from all the three species are composed of aldehydes and alcohols. However, their relative abundance differed between the three species, with the hop having the highest levels of the phenylpropanoids methyl salicylate and methyl 3-hydroxy-2-phenylpropionate, and the pear having the highest levels of the monoterpenes 1,8-cineole and α -terpinene. In contrast, the Japanese tea showed low levels of these phenylpropanoid compounds but high levels of monoterpenes. These results imply that, despite the existence of many conserved biosynthetic steps, the biosynthetic pathway differs between the species. In addition, we found that the composition of the GLVs emitted by the tea depended on the light level, indicating that light may play a role in regulating the expression of the GLVs biosynthetic pathway.The Obama administration has demanded the extradition of HSBC bank executive Chien Kuo-tsao, who is wanted in Taiwan on more than \$2 billion of charges related to bank lending fraud. US authorities are seeking the 63-year-old's arrest and extradition on accusations that he bribed bank officials in Taiwan with commissions linked to a major government-backed infrastructure project, the Associated Press reported Tuesday. U.S. prosecutors charge Chien, of Leesburg, Va., with 51 counts of conspiracy, bank and wire fraud. A Department of Justice extradition complaint, dated Tuesday, did not include details of the allegations. It said Chien was responsible for underwriting and guaranteeing more than \$1 billion in loans from the Taipei-based Industrial and Commercial Bank of China to 28 companies, including a steelmaker controlled by the son of a Chinese president, and at least two government-owned companies. Can we make them synonyms? A: Your question about the difference between audio and spectrum is actually rather good. The term spectrum can technically be used to describe any signal graphically, but it is rarely used in that way in practice. Because it involves a mathematical definition of what a graph is, it is likely to be understood better on a mathematical site, which is where that question is more likely to go. 1.
