Lightroom for the iPad is a $12.99 app, featuring a simple, elegant interface that allows working from your iOS device without switching applications, like it does on the desktop. I thought this would be a bold move, but the Lightroom for iPad application follows the usual practice of its desktop counterparts, offering create-as edits and low-res previews, but you can view photos and albums right out of your camera roll, provided you have a recent iCloud backup. The Panorama Tools are available in Lightroom 5; they are effectively equivalent to those in Photoshop CS6, but they are better because they are so much smaller in size, and look so much better in Windows 7. The new Fast Workflow buttons are a welcome addition, and I really appreciate the fact that the image editing tools can become part of the software you are currently opening, without going through some cumbersome process of switching tools. The Camera Raw 10.3 update brings a great deal of functionality back to DNG Image Galleries, and a couple of refinements like the ability to perform exposure correction "on the fly" in the HSL panel. Adobe Photoshop is still unbeatable photo editing software. Photoshop is one of the best creations of Adobe Company. It's the favorite image editing software for every professional designer. You also need a keyboard with at least two of the following key features: The basics include having a basic manual, remapping keys, and a user manual. There's also a feature called "Undo Right Above" which allows you to reverse any action. All of these features are supported in the latest version of Photoshop. It pops out when you slide your cursor toward it or when the top third of the Touch Bar is activated. The Image Processor can decode and compress images as they are loaded, allowing files to open sooner. Sharpening and Shadows are automatically detected, adjusted, and applied to images as you work. Images can also be sharpened, shadows softened, curves manipulated, lighting adjusted, and other settings applied all from the power panel. It's also possible to apply special effects and create GIFs. Creation date, size, resolution, and sometimes even the camera make and name of an image are shown at the bottom. An even more reliable information source is metadata, or info found about the image in the files.
